

Bachelor in International Economics, Management and Finance

Angelo Cardani

Learning Objectives

to master management tools typical of companies / financial institutions with a significant international dimension and operating in different economic systems increasingly integrated.

to control the basic instruments needed to develop independent analysis and assessment of the structure of an economic system, with particular reference to the European Union single market as a platform for global competition;

BIEMF is a programme designed to shape graduates whose main reference markets are global in nature, and European in perspective. BIEMF offers to its students a series of opportunities:

to learn quantitative methods for applied analysis in the macroeconomic, microeconomic and business fields;

to have a basic knowledge of quantitative and legal methods with an international focus, while providing an understanding of the institutional issues;

Learning Objectives

BIEMF students are trained from the beginning to think globally, and to examine each single issue both in itself but also as a component of a much wider picture, where interaction is the keyword.

The use of English is not the relevant feature in this programme: it does add to the international atmosphere, but the design of the programme itself is the key element.
